

## **MCI Consultants announces a new ALSI trading front-end**

MCI Consultants today announced their new front-end for the JSE's All Share Index (ALSI) trading platform and one that boasts low latency as being one of its key attributes.

“This is the first of several new derivative trading front-ends that we will be providing to the market over the coming months,” commented Jan Rabbets, Partner of MCI Consultants. “Users for some time have been demanding a stable and fast interface but at a fixed cost and this new front-end duly provides this capability. We have already successfully implemented our new front-end at certain stock brokers.”

“Historically, MCI only provided ‘white labelled’ connectors for the derivative markets that linked in to other trading solution providers; however, some of our clients have asked us to provide a more comprehensive solution with an API to which they could interface their own software,” continued Rabbets.

“MCI Consultants has been providing software to the financial markets for over ten years, including the creation of their own trading system that facilitates trading on the JSE's Tradelect,” concluded Rabbets.
